

They do not eat. They bite once and walk on. A thing that fed would have left us more survivors and far fewer of them.

They do not eat. They bite once and walk on, which is why almost everybody bitten lived long enough to turn, and why there are so many of them and so few of us. They are slower than you. They never stop. In a hard frost they stand still in the road like furniture, and in August they are quick and they are falling apart, and the difference between those two facts is the difference between a working season and a season you survive.

Ninety-nine rules for staying alive, collected out of eleven hundred notebooks by the woman who runs the Long Room, and set down with what each rule is worth and the exact place where it fails. How far you can walk before your feet decide the matter. Why the fire doors were the wrong fight. What a bite looks like on day one and what it looks like on day six. Which of the sounds you make can be heard at two miles and which cannot be heard at forty feet. When to open the door.

Every rule is signed, and the signature carries the day the writer was on. Fifty-one are verbatim, in the hand of the person named. The rules argue with each other, and they have been left arguing, because a manual that agrees with itself has been simplified into something you could get killed following.

“Count the doors before you count the exits.”

Terrance Bello, locksmith, day 9

HOW IT GOES WRONG Bello counted eleven doors in the leisure centre and made all eleven fast. When the fire took the east stand there were eleven doors and no exits, because he had welded the difference out of the building.
